FurniCraft – Literature Review

Feedback & Evaluation · Graduation Project · DEPI · October 2026

1. Feedback & Evaluation

Lecturer's assessment of the project

- **Idea:** excellent, and different from traditional e-commerce projects.
- **Proposal:** excellent, but it needs a tighter scope and a focus on execution quality.

2. Suggested Improvements

2.1 MVP priorities

The first version should focus on delivering the following sections with high quality:

- **Catalog, categories, and search:** well-organized sections and categories, and an advanced search engine with precise filters.
- **Product page and 3D product view:** full rotation and zoom; changing color, material, and size; live price updates based on the changes.
- **Purchase cycle:** cart, authentication, and checkout. The payment gateway can be in test mode or a mock at first.

2.2 Admin dashboard (simplified scope)

The admin dashboard must be kept simple and limited to the basics:

- Managing products (products, customization options, and prices).
- Managing orders.
- Managing inventory.
- Simple reports and analytics, if any.
- Avoid expanding into complex details at this stage and focus on the basics.

2.3 AI features

- **Current phase (MVP):** the AI assistant is limited to recommending products to the user.
- **Future phases, as time allows:** wishlist, and product comparison by price, model, color, and more.

2.4 Nice to have

- **Room design:** better postponed to later phases, depending on available time.

2.5 Critical challenge: 3D models

3D models are currently one of the biggest challenges.

- The source of the 3D models must be decided now, and precisely.
- **Technical requirement:** the parts of each model must be separate (for example, the frame on its own and the fabric on its own) so that color and material can be changed smoothly for each part.

2.6 Scope and prototype

- Start by deciding the exact number of products to work on at the beginning.

- Prepare at least one 3D model as a proof of concept, and test changing its color and material to confirm the idea works technically before applying it to the other products.
- Use this first experiment as the practical starting point when implementation begins.
- **Team decision:** the project starts with 4 products. The first one is built as the proof of concept, and the other products are added after color and material changes work.

3. Final Grading Criteria

Not provided yet. To be added when received from the lecturer.
